DAIKIN INDUSTRIES, LTD. Oil Hydraulic Division Oil Hydraulic Equipment

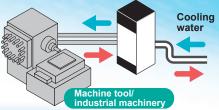

AKZ9W For cooling oil | Circulating type |

Overview/Features

Oil Cooling Unit minimizes thermal displacement in the machine.

This oil cooling unit controls the temperature of various types of oil, improving the peripheral cooling of built-in motors and internal cooling of gear boxes, while also reducing hydraulic oil temperature (viscosity) controls.

Highly accurate temperature control through inverter controlled compressor

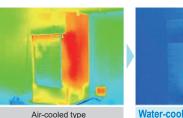

The oil temperature can be controlled within ±0.1°C over the entire cooling load range (from 0 to 100% load) improving the accuracy of the machine tool.

The water-cooled condenser type oil cooling units are "exhaust heat free". * Excluding exhaust heat from electrical parts.

The exhaust heat from the oil cooling unit is removed by cooling water. *Please prepare cooling water that meets water quality standards.

Little to no "exhaust heat" from the oil cooling unit. *Excluding exhaust heat from electrical parts.

- Enables work in a comfortable environment
- Realizes reduced air-conditioning load in the factory and energy savings
- Realize stable performance of machines that require precise temperature control in the factory

Comparison of oil cooling unit surface temperatures during operation

Time spent cleaning a clogged condenser is greatly reduced.

- Adopted a double tube condenser, which is clog resistant
- Reliable unit for long term use

Specifications are compatible with the air-cooled units. (Cooling capacity, external dimensions, etc.)

Easy to replace an existing air cooled condenser type unit with this water-cooled model if cooling water can be supplied to the unit.

Nomenclature

1 Oil cooling unit identification code AKZ: High-accuracy inverter oil cooling unit Circulating type for cooling oil Cooling capacity (kW) 56[.] 5.6 kW 1 1 1.1.1.1

Cooling Capacity Characteristic Chart

AKZ439W

AKZ909W

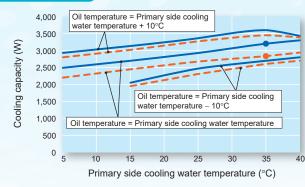

Notes on Installation and Handling

1. Request to install a water strainer

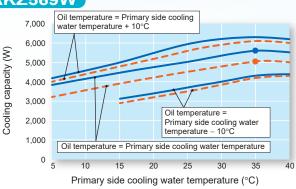

Install a strainer (20 to 40 mesh) with low pressure loss in the water piping system.

- Operation without installing a strainer at the primary side water pipe inlet will cause debris in the water piping to clog the inside of the condenser, causing unit stoppages due to abnormalities, or failure of the unit.
- Much of the debris in the water piping system adheres to the strainer during trial operation and adjustment, so please clean or replace the strainer before performing full-scale operation. In addition, please inspect and clean the strainer regularly.
- Do not use water other than that of the specified water quality when using industrial water for the primary side cooling water.

AKZ569W

Solid line When operated at 60 Hz Broken line - - When operated at 50 Hz

- The mark "●●" shows the standard point. (Primary side cooling water temperature: 35°C, rated primary side cooling water volume: see table below, inlet oil temperature: 35°C, oil used: ISO VG32, 1 atm)
- The cooling capacity varies depending on conditions such as the primary side cooling water temperature, primary side cooling water volume, inlet oil temperature, oil dynamic viscosity and other factors

Rated primary side cooling water volume

Model name	Rated primary side cooling water volume
AKZ149W	12 L/min
AKZ329W	18 L/min
AKZ439W	30 L/min
AKZ569W	42 L/min
AKZ909W	42 L/min

2. Water quality standards

* Use water that satisfies the following standard for tap water level.

Guideline of Water Quality for Refrigeration and Air Conditioning Equipment JRA-GL-02-1994

	Item	Chemical formula	Water quality standard	Unit
	pН	_	6.5 to 8.2	pH (25°C)

Note: *1. The cooling capacity indicates the value at the standard point (inlet oil temperature: 35°C, primary side cooling water temperature: 35°C, rated primary side cooling water volume: see page 2, oil used: ISO VG32, 1 atm). This unit has about ±5% of product tolerance.

*2. Use a commercial power supply for the power source. The use of an inverter power supply may cause burn damage to the machine. The voltage fluctuation range should be within ±10%. If it is more than ±10%, please consult us.

*3. The optional thermistor for machine temperature synchronization is required.

*4. The refrigerant is enclosed in a sealed container. The -C type comes with the SDS (Safety Data Sheet) for refrigerant R410A.

*5. The specifications for permissible transport vibration are those of a standard unit.

*6. Electric component section ingress protection: IP54 or equivalent (However, use piping conduits etc. rated at least IP54 at wiring ports.)

*7. The earth leakage breaker is not supplied with this product. Please prepare it yourself.

*8. The yellow line on the tank oil level gauge shows the highest oil level and the red line the lowest oil level.

Refer to Page 3 for explanatory notes.

Operating Temperature Range

Note: 1. The mark "⁽⁽)" shows the standard point.
2. Be sure to use the unit within the range of use specified in ______.

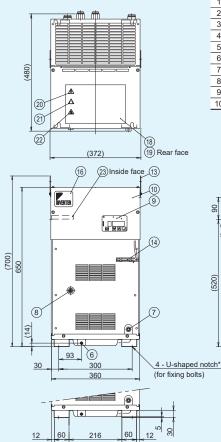

(Use outside the usable range significantly reduces cooling capacity. There is also a risk of moisture condensation.)

AKZ909W-T

$\mathsf{AKJ9W}$ For cutting/grinding fluid (oil) | Immersion type |

Overview/Features

Immersion-type oil cooling unit mounted directly on the coolant tank

It is a cooler that is placed on the coolant tank and cools the fluid inside the tank directly with a cooling coil. * The circulation pump is not provided as an accessory and must be prepared separately.

Cooling industria nachiner

Highly accurate temperature control through inverter controlled compressor

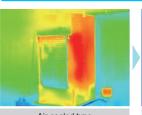

The coolant temperature can be controlled within ±0.1°C over the entire cooling load range (from 0 to 100% load) improving the accuracy of the machine tool.

The water-cooled condenser type oil cooling units are "exhaust heat free". * Excluding exhaust heat from electrical parts.

The exhaust heat from the oil cooling unit is removed by cooling water. *Please prepare cooling water that meets water quality standards.

Little to no "exhaust heat" from the oil cooling unit. *Excluding exhaust heat from electrical parts.

- Enables work in a comfortable environment
- Realizes reduced air-conditioning load in the factory and energy savings
- Realize stable performance of machines that require precise temperature control in the factory

Air-cooled type

Time spent cleaning a clogged condenser is greatly reduced.

- Adopted a double tube condenser, which is clog resistant
- Reliable unit for long term use

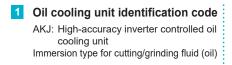

Specifications are compatible with the air-cooled units. (Cooling capacity, external dimensions, etc.)

Comparison of oil cooling unit surface temperatures during operation

Easy to replace an existing air cooled condenser type unit with this water-cooled model if cooling water can be supplied to the unit.

Nomenclature

2 Cooling capacity (kW)

18 : 1.8 kW	56 : 5.6 kW
35 : 3.5 kW	90 : 9.0 kW
$15 \cdot 15 kM$	

45 : 4.5 kW	
Symbol of series

Cooling Capacity Characteristic Chart

AKJ459W

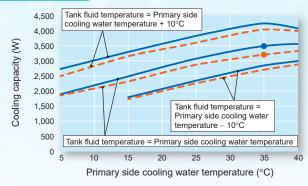

Notes on Installation and Handling

1. Request to install a water strainer

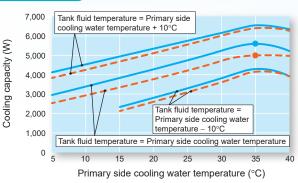

Install a strainer (20 to 40 mesh) with low pressure loss in the water piping system.

- Operation without installing a strainer at the primary side water pipe inlet will cause debris in the water piping to clog the inside of the condenser, causing unit stoppages due to abnormalities, or failure of the unit.
- Much of the debris in the water piping system adheres to the strainer during trial operation and adjustment, so please clean or replace the strainer before performing full-scale operation. In addition, please inspect and clean the strainer regularly.
- Do not use water other than that of the specified water quality when using industrial water for the primary side cooling water and cooled fluid.

AKJ359W

AKJ569W

Solid line — When operated at 60 Hz

Broken line - - - When operated at 50 Hz

- The mark "●●" shows the standard point. (Primary side cooling water temperature: 35°C, rated primary side cooling water volume: see table below, tank fluid temperature: 35°C, oil used: ISO VG32, 1 atm)
- . The cooling capacity varies depending on conditions such as the primary side cooling water temperature, primary side cooling water volume, tank fluid temperature, oil dynamic viscosity and other factors

Rated primary side cooling water volume

Model name	Rated primary side cooling water volume
AKJ189W	12 L/min
AKJ359W	18 L/min
AKJ459W	30 L/min
AKJ569W	42 L/min
AKJ909W	42 L/min

2. Water quality standards

- *Use water that satisfies the following standard for tap water level.
- Guideline of Water Quality for Refrigeration and Air Conditioning Equipment (JRA GL02E-1994)

	All Conditioning Equipment (JRA GL02E-1994)								
	Item	Chemical formula	Water quality standard	Unit

Note: *1. The cooling capacity indicates the value at the standard point (tank fluid temperature: 35°C, primary side cooling water temperature: 35°C, rated primary side cooling water volume: see page 16, oil used: ISO VG32, 1 atm). This unit has about ±5% of product tolerance.

*2. Use a commercial power supply for the power source. The use of an inverter power supply may cause burn damage to the machine. The voltage fluctuation range should be within ±10%. If it is more than ±10%, please consult us.

*3. The optional thermistor for machine temperature synchronization is required.

*4. The refrigerant is enclosed in a sealed container. The -C type comes with the SDS (Safety Data Sheet) for refrigerant R410A.

*5. The specifications for permissible transport vibration are those of a standard unit.

*6. Electric component section ingress protection: IP54 or equivalent (However, use piping conduits etc. rated at least IP54 at wiring ports.)

*7. The earth leakage breaker is not supplied with this product. Please prepare it yourself.

Thermistor (Compatible with all types of Oil Cooling Unit 9 series)

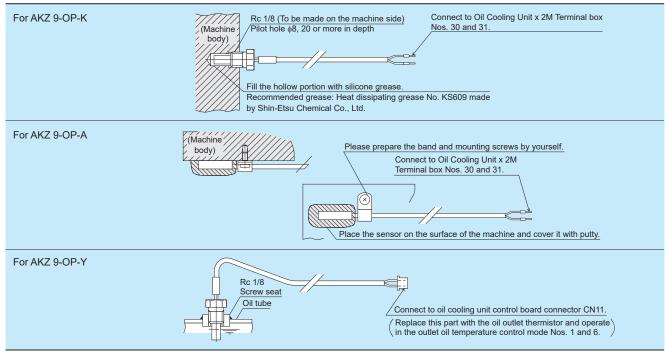

Thermistor models and applications

When this optional part is installed in the oil piping of the machine, the thermistor detects the oil or water temperature for the unit's operation.

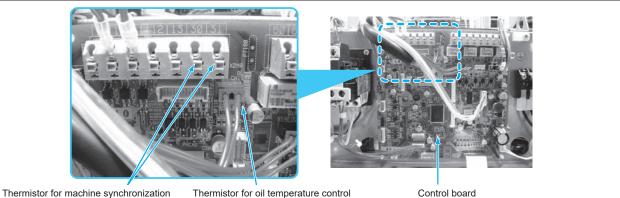

Name	Model	Length of lead wire L (m)	Figure	Application (To be installed by yourself)	Applicable Oil Cooling Unit model

Instruction for installation and connection

Installation positions of the thermistor for machine synchronization and thermistor for oil temperature control

Installation position (No. 30/31 pin)

Installation position (CN11)

Control board

Option Board for Communication

The following can be achieved by mounting this option board on the Oil Cooling Unit's control board and communicating with the machine.

- 1. Changing the operation mode and the operation setting from the machine
- 2. Reading various data such as the alarm code and temperature-related data (machine temperature, room temperature, inlet oil temperature, outlet oil temperature, inlet and outlet differential temperature, inverter frequency) of the Oil Cooling Unit from the machine

Communication method	Model	Installation position	Applicable model
Serial communication	AKZ9-OP-CS	Inside control box	AKZ149W, AKZ329W, AKZ439W, AKZ569W, AKZ909W AKJ189W, AKJ359W, AKJ459W, AKJ569W, AKJ909W
Parallel communication	AKZ9-OP-CP	Inside control box	AKZ149W, AKZ329W, AKZ439W, AKZ569W, AKZ909W AKJ569W, AKJ909W

Note: For details on the communication procedure and specifications, refer to the dedicated instruction manual

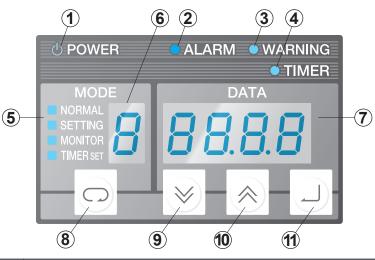

Communication board installation position: For AKZ9 (W) Series

Communication board installation position : For AKJ9 (W) Series)

Part Names, Functions and Operation of Control Panel

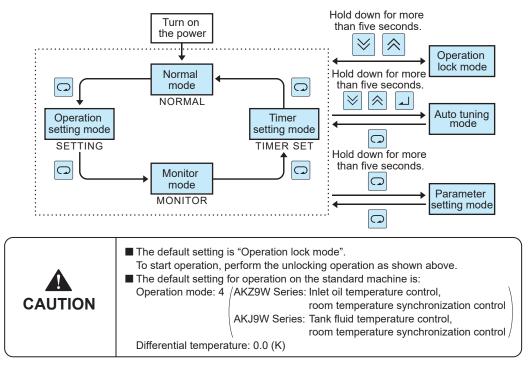

NO.	Item	Description		
1	Power light (Green)	The light is turned on while power is supplied.		
2	Error warning light (Red)	When an error occurs Level 1 alarm: The light keeps blinking. Level 2 alarm: The light is continuously on.		
3	Warning light (Green)	When a warning occurs Level 1 warning: The light keeps blinking. Level 2 warning: The light is continuously on.		
4	Timer mode light (Green)	The light keeps blinking while the machine is at a stop in the timer mode.		
5	Operation mode display	Displays the mode of the control panel. NORMAL: Normal mode MONITOR: Monitor mode TIMER SET: Timer setting mode TIMER SET: Timer setting mode TIMER SET: Timer setting mode		
6	Operation mode/ Data No. display	Displays the current operation mode (Normal mode/Operation setting mode) or data number of the data currently displayed on the data display.		
\bigcirc	Data display	Displays various data. The data displayed differs depending on the operation mode and data number.		
8	[SELECT] (Select) key	Selects the operation mode.		
9	[DOWN] key	Decrements the value of the operation mode, data number or data by 1. When held for two seconds or longer, decrements the values by 10.		
10	[UP] key	Increments the value of the operation mode, data number or data by 1. When held for two seconds or longer, increments the values by 10.		
1	[ENTER] (Determine) key	Determines the operation mode, data number, and data to be changed.		

Operation for changing to each mode

A mode can be changed by operating the 🖸 key in general.

To enter a special mode, hold down a number of keys in combination for more than five seconds.

OIL COOLING UNIT

Operation Mode and Setting Method

Watch a video on the relationship between control and accuracy!

		\sim		
AKZ	UNA.		or	00
		\sim	CII	63

Operation mode No. Mode name		Description	Setting temperature range	Necessary optional part
Operation mode 0	Inlet oil temperature, fixed temperature control	Keep the inlet oil temperature at the setting temperature within the range specified in the right column.	5 to 50°C	
Operation mode 1	Outlet oil temperature or return oil temperature control, fixed temperature control	Keep the outlet oil temperature or return oil temperature at the setting temperature within the range specified in the right column.	5 to 50°C	Oil temperature control thermistor (When return oil temperature is controlled)
Operation	Inlet oil temperature, room temperature synchronization control	Keep the inlet oil temperature at the setting temperature within the range specified in the right column.	Between Room temperature –9.9°C and Room temperature +9.9°C	
mode 4	Inlet oil temperature, machine temperature synchronization control	Keep the inlet oil temperature at the setting temperature within the range specified in the right column.	Between Machine temperature –9.9°C and Machine temperature +9.9°C	Machine synchronization thermistor
Operation	Outlet oil temperature or return oil temperature control, room temperature synchronization control	Keep the outlet oil temperature or return oil temperature at the setting temperature within the range specified in the right column.	Between Room temperature –9.9°C and Room temperature +9.9°C	Oil temperature control thermistor (When return oil temperature is controlled)
mode 6	Outlet oil temperature or return oil temperature control, machine temperature synchronization control	Keep the outlet oil temperature or return oil temperature at the setting temperature within the range specified in the right column.	Between Machine temperature –9.9°C and Machine temperature +9.9°C	Oil temperature control thermistor (When return oil temperature is controlled) Machine synchronization thermistor

AKJ 9W Series

71110 011 0									
Operation mode No.	Mode name	Description	Setting temperature range	Necessary optional part					
Operation mode 0	Tank fluid temperature, fixed temperature control	Maintains the tank fluid at a fixed temperature	5 to 50°C						
		Synchronizes the tank fluid temperature with the room temperature	Room temperature –9.9 to +9.9 (K)						
mode 4	Tank fluid temperature/machine temperature synchronization control	Synchronizes the tank fluid temperature with the machine temperature	Machine temperature –9.9 to +9.9 (K)	Machine synchronization thermistor					

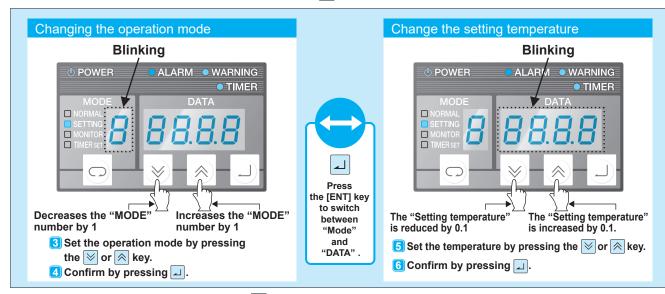

Note: Refer to Page 23 for details of required optional parts.

Setting procedure

Default setting: Set to operation mode 4, and a temperature of "0.0" When you use your machine at a setting other than the default setting, change the setting following the procedure shown below.

Power ON ···· Release the operation lock mode before starting operation for the first time. (Hold down the interval and interval keys together for at least 5 seconds.)

2 Select the "SETTING" operation setting mode. (Press the 📿 key once)

7 To return to the "NORMAL" mode, press the 📿 key three times.

Points Checked in the Monitor Mode

The following points can be checked in the monitor mode.

Monitor	Description			Monitor	Description		Nete
No.	AKZ9W	AKJ9W	Note	No.	AKZ9W	AKJ9W	Note
0	Room temperature or machine body temperature [Th1]		*1	5	riangle T (Th4 to Th2)	-	*1
1	Outlet oil temperature or return oil temperature [Th2]	-	*1	6	Cooling capacity contr	. ,	-
2	Primary side cooling w	ater temperature [Th3]	*1	7		rotational speed (rps)	-
3	Inlet oil temperature [Th4]	Tank fluid temperature	*1	8	Power consumption*3	Power consumption*4	-
4	Reserved [Th5]	Intake gas temperature [Th5]	*1	9	Extended DIN (hundreds digit), DOUT (tens digit) status		*2

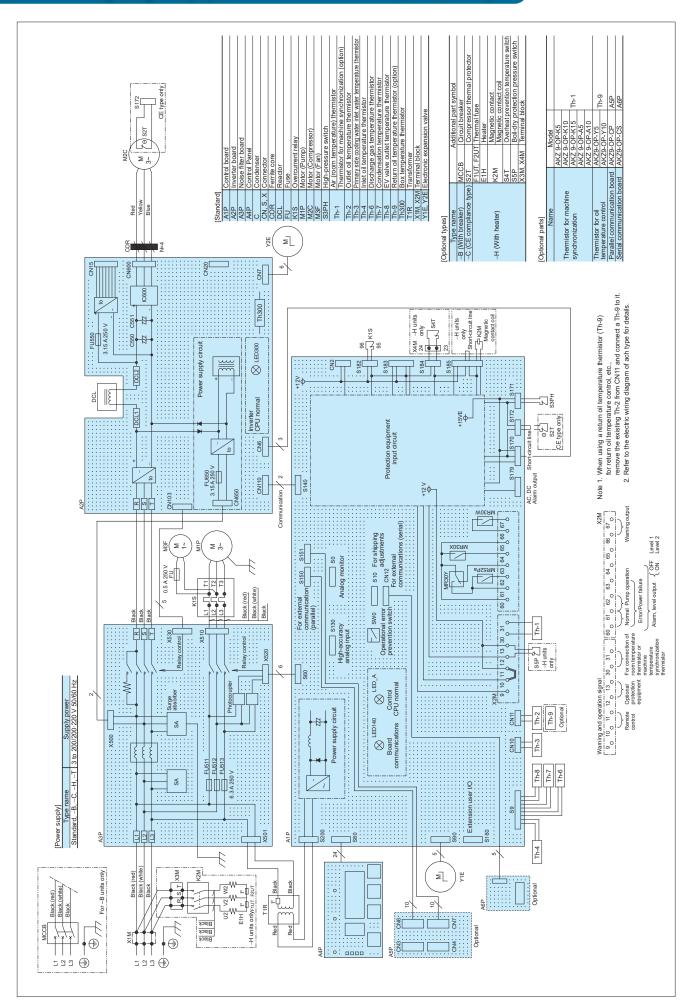

*1. If the thermistor is not connected or has a broken wire. -99.9 is displayed.

*2. With the default setting, 0 is displayed. Note that display is enabled when parameter n020 is "1" or the optional communication extension board is installed.

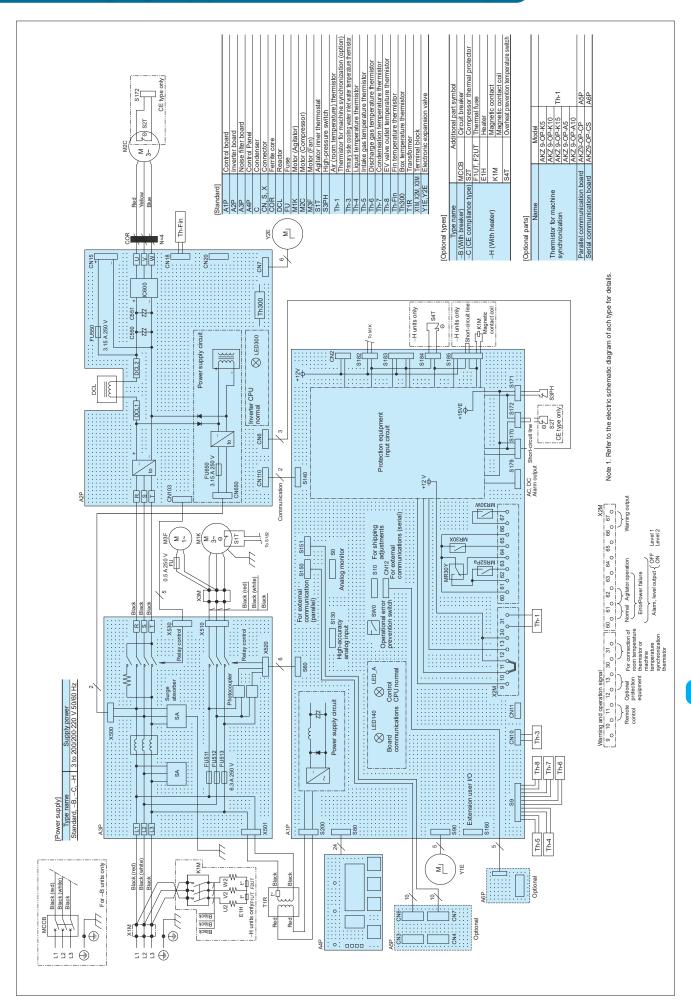

*3. This is the value obtained by rough calculation under the following conditions (the error is around 20%): power supply voltage of 200 V, pump discharge pressure of 0.2 MPa (VG32: oil temperature 25°C).

*4. This is the roughly calculated value with a power supply voltage of 200 V (the error is approximately 20%). Contact us separately about pumpless units in the AKZ Series.

Electric Wiring Diagram (representative model of AKZ9W Series)

OIL COOLED CONDENSER TYPE

Supplementary Information

Electric Wiring Diagram

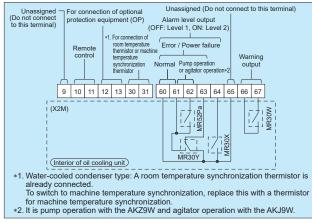

Electric Wiring Connection Instruction

of the specification table (AKZ9W: Pages 3 and 4, AKJ9W: Pages 17 and 18).

2 Connection to power supply terminal block (X1M, Tr)						(1) (2)		
 With the standard and optional (-C, -H, -T) types: Connect to X 1 M. With the "with breaker" (-B) specifications: Connect to the breaker. 						$\begin{array}{c c c c c c c c c c c c c c c c c c c $		
1. Screw terminal and wiring diameter						I L2 L3		
	Series	Terminal Screw block terminal	Wiring diamet		ter			
	Selles		JIS cable	IEC cable	UL cable			
	AKZ 149W, 329W, 439W, 569W	X1M	M4	2.0 mm ²	2.5 mm ²	AWG#14		
	AKJ 189W, 359W, 459W, 569W Breaker M5 or greater		or greater	or greater				
	AKZ 909W	X1M	M5	3.5 mm ²	4.0 mm ²	AWG#12		
	AKJ 909W		M5	or greater	or greater	or greater		

- 2. Use a round crimp-style terminal for connection.
- 3. The terminal block is for three poles and the earth wire is to be secured on the enclosure with a screw.

3 Connection to signal terminal block (X2M)

1. Straight crimp terminal and wiring diameter

Straight	Wiring diameter					
pin terminals	JIS cable	IEC cable	UL cable			
*	0.25 mm ² to 1.25 mm ²	$0.3\ mm^2$ to $1.5\ mm^2$	AWG#22 to #16			

- 2. Use a straight crimp-style terminal for connection.
- 3. Use stranded wires for electric connection.

4. The wiring size is 0.5 mm² to 1.5 mm² in the case of duplex cable according to IEC. If using stripped wire, make the stripped length 9 mm to 10 mm.

*Recommended models and manufacturers: TGN TC-1.25-9T (NICHIFU Co., Ltd.)

4 Signal output time chart

(1) Alarm/operation status output chart

DANGER

- 1. Always install an all-pole (3-pole) circuit breaker* (to be prepared by you) of the specified capacity on the main power supply. *All contact distances must be at least 3 mm.
- 2. Always ground the machine. Since a noise filter is installed, there is a risk of electrical shock without proper grounding.
- 3. Before opening the electric component box, always turn off the power, and wait for 5 minutes until internal high voltage has been discharged.
- 4. Do not energize the equipment with the electric component box kept open

CAUTION

- 1. To avoid the effects of noise, connect the power wire by cutting it to the proper length so that no excess wire comes into contact with the control board or elsewhere.
- 2. To perform remote control, remove the short-circuit wire between [10] and [11] and install an operation switch (to be prepared by you).
- 3. The mode is set to "Lock mode (Stop mode)" by default. Before starting operation, follow the procedure to release the Lock mode from the operation panel. Refer to the operation manual for the unlocking procedure.
- 4. The unit is provided with a misoperation prevention switch (PROTECT) to reject setting from the operation panel. If you want to use this function, make the necessary setting referring to the operation manual.

	Operation status			Remote	e operation (b	etween [10] a	ind [11])		
			ON			OFF			
Signal output		Normal	Level 1 error or LOCK	Level 2 error	Power failure (Power OFF)	Normal	Level 1 error or LOCK	Level 2 error	Power failure (Power OFF)
Normal ("a" contact)	60-61 ON OFF								
Error/Stop (Power OFF) ("b" contact)	60-63 ON OFF								+
Error level ("a" contact)	60-64 ON OFF				-				1
Pump operation ("a" contact)	61-62 ON OFF		-		-				<u> </u>

(2) Warning output chart

Operation status			Non-warn	ing status			Warnin	g status	
Signal output		Normal	Level 1 error or LOCK	Level 2 error	Power failure (Power OFF)	Normal	Level 1 error or LOCK	Level 2 error	Power failure (Power OFF)
Warning output ("a" contact")	66-67 ON OFF								

CAUTION 1. The following electric wires can be used on the terminal block for straight crimp-style terminals. \$0.57 to \$1.44 (AWG#22 to #16) Single wire:

- Stranded wire: 0.25 mm² to 1.25 mm² (AWG#22 to 16) 2. Load applicable to [60 - 64] and [66 - 67] is as follows: Min. applicable load: DC 10 mV, 10 µA or more Max. applicable load: DC 30 V, 2 A (Resistance load)
- 3. For [10] to [13], please prepare contacts to meet the condition of minimum applicable load DC 12 V and 5 mA.
- 4. When the length of the thermistor to be connected to [30] - [31] is longer than 10 m, or the wiring is routed in a poor noise environment, use shielded wire.

WATER-COOLED CONDENSER TYPE

Notes for Installing Piping Outside the Machine

If the external pressure loss (site piping resistance) exceeds the specified use range, phenomena such as abnormal noise of the pump (relief noise, noise of cavitation), decrease of cooling capacity and control failure of oil temperature may occur.

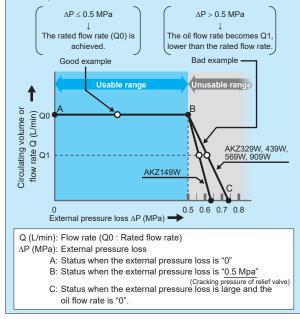

- 1. Suction-side piping
- Keep the suction vacuum pressure within the range between -30.7 and 0 kPa. The use of a suction filter of 100 to 150 mesh is recommended.
- Discharge-side piping Keep the pressure loss of the discharge-side piping at 0.5 Mpa or less.
- 3. Do not install a stop valve on the suction or discharge side. When a stop valve must be installed on the discharge side out of necessity, use a 0.5 Mpa relief valve along with the stop valve.
- Calculation of piping resistance Determine the oil piping size by calculating the piping resistance according to the following equation:

Piping resistance $\Delta P = 0.595 \times v \times Q \times L/D^4$ (For use of general hydraulic oil and lubricant)

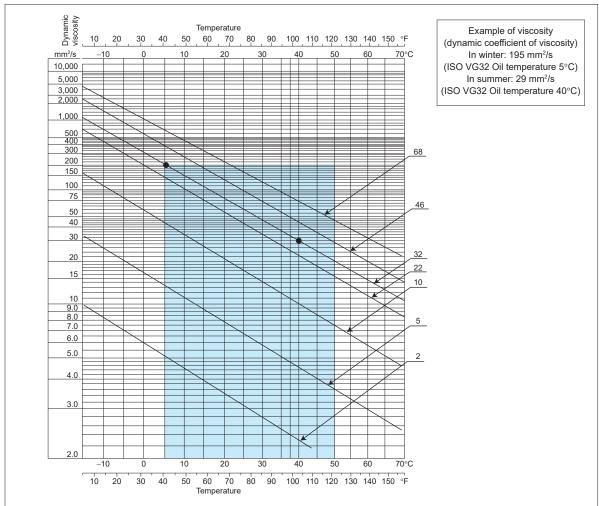

- △P: Piping resistance (MPa)
- v: Dynamic coefficient of viscosity (mm²/s) Refer to the Viscosity/Temperature Chart.
- Q: Flow rate (L/min) L: Piping length (m)
- L: Fiping length (m)
- D: Internal piping diameter (mm)

• Relationship between oil flow rate and external pressure loss

An AKZ9W Series Oil Cooling Unit incorporating a pump of the circulating type has the characteristics shown below. When the external pressure loss (Δp) is 0.5 MPa or less, the rated flow rate (Q0) is achieved, but when the external pressure loss exceeds 0.5 MPa, the flow rate becomes lower than the rated flow rate.

Note: Design the site piping to withstand a pressure of at least 1.0 MPa.

■Viscosity/Temperature Chart

Notes for Handling

•Important notes to be observed regarding the machine side (machine tools and industrial machinery)

- When rough transport conditions are expected while transporting the machine overseas or elsewhere, special precautions should be taken in the packaging and transportation method so as to avoid the application of excessive force on the oil cooling unit.
- The Oil Cooling Unit (this unit) does not incorporate a flow switch for checking the oil supply or a temperature switch for abnormal temperature (high temperature or low temperature) of oil supplied. So, please provide protection devices such as a flow switch and temperature switch at the machine.

Notes for operation and cooling capacity

- 1. Do not use an Oil Cooling Unit for cooling a liquid at 50°C or more. Start to operate the Oil Cooling Unit at the same time as the machine or before the liquid temperature rises to 40°C.
- 2. Do not place an object that hinders ventilation within 500 mm of the air-intake or exhaust.
- 3. The condenser should be cleaned periodically, about once a year. Please refer to the operation manual for the cleaning method.
- 4. If cutting chips and powder-like chips deposit on and adhere to the cooling coil (evaporator) in the AKJ9W Series, the cooling capacity should be diminished and it could cause failure. To avoid the adherence of deposits on the cooling coil, install an efficient return filter on the return side (fluid inlet) of the tank and periodically clean inside the tank.

Notes on usable fluids with oil cooling units

1. The fluid usable with the oil cooling unit is listed in the table below for each series.

2. Do not use fluid listed below as "x"

	Description	AKZ9W Series	AKJ 9W Series
Lubricating oil Mineral hydraulic oil	 Oil that is classified as third class petroleum or fourth class petroleum of the fourth group hazardous materials stipulated in the Fire Defense Law and that corresponds to discoloration No. 1 in the copper corrosion test method (JIS K2513) of petroleum products 	V	\checkmark
Nonflammable hydraulic oil Phosphate ester hydraulic fluid Chlorinated hydrocarbon series Water - Glycol series W/O·O/W emulsion series (High-aqueous hydraulic oil)		×	×
 Coolant fluid Water-soluble cutting and grinding fluid Non water-soluble cutting and grinding oil 		×	\checkmark
Ethylene glycol (Antifreeze liquid)	Fluid not including any ingredient that	×	\checkmark
Water (Industrial water)	corrodes the SUS304 material used for the evaporator coil	×	\checkmark
Inflammable fluid like fuel	Liquid equivalent to special flammables, alcohol, first class petroleum and second class petroleum of the fourth group hazardous materials specified according to the Fire Defense Law	×	×
Chemicals		×	×
Liquid for food products	Drinking water, water for cooling food products, etc.	×	×

*Before operating this unit, be sure to read the operation manual and properly understand it.

 Instructions for safe operation 				
	NGER ······ Failure to observe the instruction may cause an imminent hazardous situation that may result in			
Signs and Instructions	personal death or serious injury. ARNING ···· Failure to observe the instruction may result in personal death or serious injury.			
	UTION ····· Failure to observe the instruction may result in personal injury or damage to the property.			
(1) General in	nstructions			
[ADANGER]	① Use the equipment only in accordance with the intended specifications (specified in brochure, specification sheet, operation manual, and caution plates).			
[Q Never operate the equipment in an explosive atmosphere. Do not disassemble, repair or modify the equipment by yourself. 			
[ADANGER]	④ Always comply with the laws and regulations for safety (Industrial Safety and Health Law, Fire Defense Law, and JIS B 8361 Guidelines of Hydraulic System).			
[^A WARNING]	 © Caution in the event of refrigerant leak Ventilate the room adequately (to avoid the risk of suffocation). 			
	 Avoid direct contact of the refrigerant with skin (to avoid the risk of cryogenic burns). In the event of inhalation of a great deal of refrigerant, contact with skin, or refrigerant in the eye, seek medical attention immediately. 			
[①WARNING]	b In the event of an abnormal condition, stop operation promptly, investigate the cause of the problem and take			
[ACAUTION]	appropriate remedial measures. © Do not use the unit in atypical environments (locations subject to high temperatures, high humidity, or a lot of dust,			
	contamination, particulate matter, steam, oil mist or corrosive gases: H ₂ S, SO ₂ , NO ₂ or CL ₂). (a) Install a flow switch and temperature switch on the machine to protect the spindle and other components.			
	be shortened due to the reduced air pressure.			
\smile	ns for transportation			
[^{(]} DANGER] [^{(]} DANGER]	 When hoisting the equipment, check its weight and use the eye plates and hangers on it properly. When hoisting the equipment, do not do so while it is fitted with a tank or anything else that you have provided. 			
	③ Do not approach the equipment while it is being hoisted and moved.			
	© Do not tilt the equipment 30 degrees or more while transporting it (including during storage).			
3 Instruction	ns for installation			
	Install the equipment on a rigid, level foundation and secure it appropriately.Do not place an object near the suction port or discharge port of the equipment.			
\smile	ns for wiring and piping installation			
[①DANGER] [①DANGER]	 Wiring and piping installation should be performed by a person with specialized knowledge and skills. Always use a commercial power supply for the power source. (The use of an inverter power supply may cause burn damage). 			
[①DANGER]	© Connect the wiring for power supply in accordance with the electric wiring instruction diagram of the specification sheet and operation manual.			
[ADANGER]	Ground the equipment properly.			
	 Install the wiring in accordance with the standard by checking the electric wiring diagram. Always install a dedicated all-pole (3-pole) circuit breaker appropriate for the capacity of Oil Cooling Unit on the main power supply on site. 			
[ACAUTION]	 ⑦ Check that the oil piping has a pressure resistance of at least 1 MPa (and is usable at negative pressures too at the suction side) and install it reliably. 			
[ACAUTION]	(a) Check to see that the primary side cooling water piping has a pressure resistance of 1 MPa or more and install the piping appropriately.			
(5) Instruction	ns for trial run			
[ACAUTION] [ACAUTION]	 ① Check to see that the machine is in a safe status (not activated) before starting the trial run. ② Check to see that the oil piping and electric wiring are correctly connected to the machine and that there is no looseness in connections and joints. 			
	③ Disable the operation lock of the equipment (Oil Cooling Unit) before starting the machine.			
	 ④ Check to see that the required amount of oil is in the oil piping system and that the piping is not blocked partway along. ⑤ Check that the tank contains the correct volume of the fluid used. (For AKJ) 			
6 Instruction	ns during operation			
[🛆 WARNING]	 ① Do not splash water or liquid on the equipment. ② Do not push your finger or an object into gaps of the equipment. ③ Do not touch the heated exhaust port of the equipment. 			
	ns for maintenance and inspection			

[ADANGER] OPerform maintenance and inspection with the equipment kept open. Working in a closed status may result in suffocation due to the leak of refrigerant.

- [©] Always turn off the main power supply before starting maintenance and inspection.
- [ADANGER] [ADANGER] ③ Wait for five minutes after turning off the main power supply before starting maintenance and inspection operation. [ADANGER] I Do not operate the equipment with its cover opened.
- Wear protective gear such as gloves and an eye protector when performing maintenance, inspection and cleaning.
 Keep oil cleanliness to NAS 10 level or lower according to the pollution level.
 Check the oil level in the tank and ensure that it is between the yellow line and the red line.

 - Inspect the underneath (drain pan) of the oil cooling unit once every six months, and if oil has accumulated,

 discharge it through the oil drainage port.
 © Clean the oil cooler periodically to ensure that there is no accumulation/adhesion of chips, etc. (For AKJ) ® Use water that satisfies the standard given on page 2.

Notes for Handling

Selection Method for Oil Cooling Units

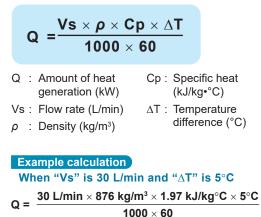

Unit conversion formula •1 kW = 860 kcal/h

- 1. Select an oil cooling unit with a cooling capacity 20 to 30% larger than the amount of heat generated from the machine tool.
- Since the cooling capacity of an oil cooling unit varies with changes in fluid temperature (fluid inlet temperature) and room temperature, the fluid temperature and room temperature conditions must be clarified in order to select the appropriate oil cooling unit.
- 3. Three methods are described here (calculation examples (1), (2) and (3)) as a guide to estimating the amount of heat generated from the machine tool. Ultimately, tests have to be conducted to determine the exact amount of heat generation for selecting the appropriate oil cooling unit.

For cooling the spindle of a machining center (AKZ)

Example calculation 1 Estimating the amount of heat generation from the temperature difference between the inlet and outlet for oil going to the machine

Example calculation (2) When the motor output loss is considered to be the amount of heat generation

$$Q = H \cdot \frac{\eta}{100}$$

- Q: Amount of heat generation (kW)
- H : Motor output (kW) \cdots For driving the spindle
- η : Motor output loss (%)

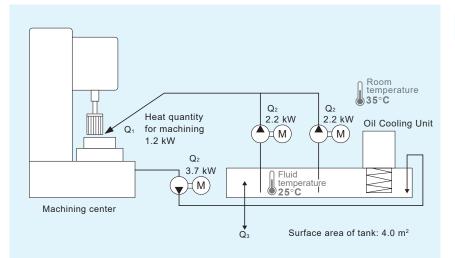

Example calculation When the output loss is 30% with a motor output of 7.5 kW → The output loss is 30% or so in general (Cooling of spindle head) Q = 7.5 × 0.3 = 2.3 (kW)

≈ 4.31 kW

For cooling cutting/grinding fluid (AKJ)

- 1. Since the tank capacity and pump flow rate are generally large the heat load from the cutting and grinding fluid system shou ld be roughly estimated according to the following formula. After rough estimation, the heat load should be determined by conducting tests on the actual machine to select the oil cooling unit.
- 2. Select a model with a cooling capacity 20 to 30% larger than the amount of heat generation from the machine tool.

Example calculation (3) General guide for heat generation

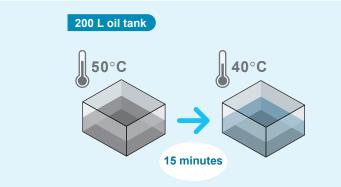

Example calculation When $Q_1 = 1.2 \text{ kW}$ $Q_2 = (2.2 + 2.2 + 3.7) \times \frac{50}{100} \approx 4.1 \text{ kW}$ (For a coolant pump, " η " is generally 50%.) $Q_3 = 20 \times 4 \times (35 - 25) / 1000 = 0.8 \text{ kW}$ $\therefore Q = Q_1 + Q_2 + Q_3$ = 1.2 + 4.1 + 0.8= 6.1 kW

$\mathbf{Q} = \mathbf{Q}_1 + \mathbf{Q}_2 + \mathbf{Q}_3$

- Q : Heat load of the entire machine tool system
- Q₁ : Amount of heat generated during machining on a machine tool
- Q₂ : Amount of heat generation of the pump motor for coolant pump (Amount of heat transferred to coolant)
 - : Q₂ = Pump motor output (kW) × $\frac{\eta}{100}$
- Q_3 : Heat balance between coolant and room temperature via coolant tank $Q_3 = K \cdot A \cdot \Delta T$
- K : Heat transfer coefficient (W/m²•°C), K = 11.6 to 23.2 in general
- A : Surface area of tank in contact with fluid (m²)
- ∆T : Room temperature-Controlled liquid temperature in tank (°C)

When it is desired to reduce the temperature of the fluid in the tank within a fixed time (AKZ, AKJ)

Example calculation 4

Note: Depending on the tank and piping surface area and ambient temperature, heat absorption and heat dissipation may increase. If the effect of heat absorption and heat dissipation is large, select a model with this effect taken into account.

$Q = \frac{V \times \rho \times Cp \times}{1000 \times 60 \times}$					
Q : Amount of heat generation (kW)	Cp : Specific heat (kJ/kg•°C)				
V : Tank fluid capacity (L) ρ : Density (kg/m ³)	∆T : Temperature difference (°C)				
	t : Time (min)				
Example calculation					
When it is desired to cool 200 L of hydraulic oil from 50°C to 40°C within 15 minutes					

 $D = \frac{200 \text{ L} \times 876 \text{ kg/m}^3 \times 1.97 \text{ kJ/kg}^\circ \text{C} \times (50 - 40)^\circ \text{C}}{1000 \text{ c}}$

1000 imes 60 imes 15 min

A cooling capacity of **approx. 3.83 kW** or greater is required.

Physical property values

Name of substance	Specific heat kJ/(kg°C)	Density (kg/m ³)
Water	4.18	998
Lubricating oil/hydraulic oil	1.97	876
Water-soluble coolant (10x dilution with water)	3.94 to 4.10	991
Aluminum	0.900	2710
Iron	0.460	7870
Copper	0.385	8960

- * The numbers in the table are reference values, so please use them as a guide.
- * All property values (some being calculated values) are at 20°C.

OIL COOLING UNIT

Overseas Service Network

Please contact DAIKIN Sales Counter for servicing of Oil Cooling Unit in countries outside Japan. Daikin is ready to offer you service in conjunction with the sales agents of our Air-conditioning and Hydraulic Divisions located in worldwide countries and regions.
